Option for additional transmitters (door buttons).

Multi-channel switches can divide the lighting into separate loops that can be controlled together or separately with a RF remote.

### 150 lm/W

Built-in surge protection device 20 kV/10 kA (max)

Fast disconnect scissor interrupter

ø60 mm flange with ±15° angle regulation (horizontal and vertical) allows a choice of the mounting angle, as well as mounting the lamp straight onto a pole

Dimmable programmable driver (ENEC) with built-in overheating, overvoltage, and short circuit protections

- The lamp has a built-in overvoltage protection, ensuring resistance to supply voltage peaks and surges up to 10 kA / 20 kV
- Adjustment of the output current
- Compensation of the luminous decay of the LEDs
- Choice between three types of working schedule with the corresponding timers:
  - 1) The driver automatically calculates when midnight is and adjusts the schedule itself.
  - 2) The driver corrects its power ON time automatically.
  - 3) The driver follows a pre-programmed curve without making calculations.

### Φ – LUMINOUS FLUX

Luminous flux represents the amount of light radiated from a lighting source (lighting fixture). Abbreviation: **Φ**. Unit: **lm** (lumen).

### EFFICIENCY OF THE LIGHT SOURCE

This is the ratio between the emitted luminous flux and the electrical power consumed in the process. It is a measure of a lamp's economic efficiency. Measured in **lm/W**.

### I – LUMINOUS INTENSITY

Luminous intensity describes the quantity of light that is radiated in a particular direction. It stands for the distribution of light, which is best seen at the lighting intensity distribution curve (LDC), formerly called photometric curve.

Abbreviation: **I**. Unit: **cd** (candela).

$$I[\text{cd}] = \Phi [\text{lm}] / \Omega[\text{sr}]$$

**I** – Luminous intensity, **Φ** – Luminous flux, **Ω** – solid angle into which luminous flux is emitted.

### E – ILLUMINANCE

Illuminance is a measure of how much a luminous flux illuminates a given surface.. Abbreviation: **E**. Unit: **lx** (lux).

$$E[\text{lx}] = \Phi [\text{lm}] / A [\text{m}^2]$$

**E** – Illuminance, **Φ** – Luminous flux, **A** – area hit by luminous flux.

### L – BRIGHTNESS

Brightness is a basic magnitude perceived by the human eye. The brightness of a given surface (radiating or reflecting) basically depends of its reflection coefficient (material and colour) and the angle of perception.

Abbreviation: **L**. Unit: **cd/m<sup>2</sup>** (candela per square meter).

$$L [\text{cd}/\text{m}^2] = I [\text{cd}] / A \cdot \cos\epsilon$$

**L** – Brightness, **I** – Luminous intensity, **A\*cosε** stands for the surface visible from a given dimensional angle.

### Pst

Pst is a quantitative flicker indicator. A value of Pst = 1 means that, on average, a statistical observer has a 50% probability of detecting a flicker (ripple).

### FLICKER-FREE

Flicker of the light is irritating to the eyes, no matter if it's visible or not. Long-term exposure to this kind of light can cause headaches and congestion. It is forbidden to have it in industries where there are fast moving or rotating objects, because of the risk of stroboscopic effect.

### UGR – GLARE, DISCOMFORT

In order to rate the glare in a given environment a Unified Glare Rating (UGR) has been adopted. A detailed description of its calculation formula can be found inside the EN 12464-1. The glare depends on the parameters of the lighting source, the size of the room, the general illuminance, and the viewing angle. For most of the administrative premises UGR must not exceed 19, for the light industry – 22, for the heavy industry – 25.

### COLOUR TEMPERATURE

Colour temperature of a lighting source corresponds with the way it is perceived.

For practical purposes a colour temperature scale has been adopted.

Its measuring unit is called Kelvin [K].

| Colour temperature | Light colour | Appropriate application   |
|--------------------|--------------|---------------------------|
| <3300 K            | Warm         | Residential buildings     |
| 3300 – 5300 K      | Neutral      | Offices, working premises |
| >5300 K            | Cold         | High levels of luminance  |

The choice of colour temperature has a psychological and esthetical aspect (personal preferences), and depends on which temperature is considered as natural. Determining factors are the level of illuminance, the colour(s) of the room and its furnishing, the purpose of the room/premises and even the climate. People living in colder climates prefer the warmer light and vice versa.

Colour temperature, measured in kelvin (K)

**RA – COLOUR RENDERING**

Colour rendering relates to the way objects appear under a given light source. The measure is called colour rendering index (CRI). Generally, CRI measures a given light source's ability to show object colours "realistically" or "naturally" compared to a reference source, either incandescent light or daylight. Their CRI equals approx. 100 (which is also the maximum CRI).

There is no direct relation between CRI and colour temperature. The same refers to any colour temperature.

**DF – DISPLACEMENT FACTOR (POWER FACTOR)**

Power factor refers to the AC (alternate current) systems. It is dened as the ratio of the real power owing to the load to the apparent power in the circuit and it is a dimensionless number in the closed interval of 0 to 1. The power factor is decisive for the load in the AC circuit.

Abbreviation – **DF, cosφ, cosφ, λ**

According to the EU Directive 2009/125/EQ, the following power factor requirements for LED luminaires have been introduced::

|                 |                |
|-----------------|----------------|
| Pon ≤ 5W        | no restriction |
| 5W < Pon ≤ 10W  | DF ≥ 0.5       |
| 10W < Pon ≤ 25W | DF ≥ 0.7       |
| Pon > 25W       | DF ≥ 0.9       |

**INTERNATIONAL PROTECTION (IP) CODE**

The **IP** protection index (see BDS EN 60529) classifies and rates the degree of protection from physical intrusion of dust and water in mechanical casings and electrical enclosures. The first digit of the code indicates the solid particle protection, the second is for liquid ingress protection.

| First digit | Description   | Second digit | Description  |
|-------------|---|--------------|--|
| 0           | Unprotected   | 0            | Unprotected  |
| 1           | Protection from solid objects bigger than 50 mm.    | 1            | Protection from dripping water   |
| 2           | Protection from solid particles bigger than 12 mm.  | 2            | Protection from dripping water when tilted at 15°                        |

|             |   | 8            | Full water immersion protection  |

**IK RESISTANCE CODE**

The **IK** resistance code (see BDS EN 62262) rates the resistance of the equipment to mechanical impact. The latter is measured in joules (J).

|                       |               |      |     |      |     |     |    |    |    |    |    |
